 î·'ê²fî·' ëª©í'æë¼ ë<¬î,,±í·©ë<^ê¹€?

- A. î~^
- B. î·,,ë<^îš"

Answer: B
 Explanation:

Explanation
 You need to change to Basic pricing Tier.
 Note: The Free Tier provides 60 CPU minutes / day. This explains why Appl is stops. The Basic tier has no such cap.

NEW QUESTION: 3

What should be done prior to backing up an IOS image to a TFTP server? (Choose three.)
 A. Make sure that the server can store binary files.
 B. Verify file naming and path requirements.
 C. Make sure that the server can be reached across the network.
 D. Check that authentication for TFTP access to the server is set.
 E. Assure that the network server has adequate space for the IOS image.
 F. Adjust the TCP window size to speed up the transfer.

Answer: B,C,E

Explanation:
 This question is to examine the Cisco IOS management. Prior to backing up an IOS image to a TFTP server, the following actions should be taken:
 Ensure the accessibility between the TFTP server and the device.
 Use the show version command to examine the IOS information to ensure that the network server has adequate space for the IOS image.

So we choose A, C, D.

NEW QUESTION: 4

- A. Option C
- B. Option D
- C. Option B
- D. Option A
- E. Option F
- F. Option G
- G. Option E

Answer: B,C,F

Explanation:

B:

*A PDB would have its SYSTEM, SYSAUX, TEMP tablespaces. It can also contain other user-created tablespaces in it.

*There is one default temporary tablespace for the entire CDB. However, you can create additional temporary tablespaces in individual PDBs.

D:

*There is a single redo log and a single control file for an entire CDB

*A log switch is the point at which the database stops writing to one redo log file and begins writing to another. Normally, a log switch occurs when the current redo log file is completely filled and writing must continue to the next redo log file.

G: instance recovery The automatic application of redo log records to uncommitted data blocks when a database instance is restarted after a failure.

Incorrect: Not A:

*There is one set of background processes shared by the root and all PDBs. -

*High consolidation density. The many pluggable databases in a single container database share its memory and background processes, letting you operate many more pluggable databases on a particular platform than you can single databases that use the old architecture.

Not C: There is a separate SYSAUX tablespace for the root and for each PDB.

Not F: There is a separate SYSTEM tablespace for the root and for each PDB. -
