NEW QUESTION: 1
Which private VLAN access port belongs to the primary VLAN and
can communicate with all interfaces, including the community
and isolated host ports?
A. promiscuous port
B. isolated port
C. community port
D. trunk port
Answer: A
Explanation:
Explanation/Reference:
Explanation:
The types of private VLAN ports are as follows:

Promiscuous--A promiscuous port belongs to the primary VLAN. The promiscuous port can

communicate with all interfaces, including the community and isolated host ports, that belong to those secondary VLANs associated to the promiscuous port and associated with the primary VLAN.
You can have several promiscuous ports in a primary VLAN. Each promiscuous port can have several secondary VLANs, or no secondary VLANs, associated to that port. You can associate a secondary VLAN to more than one promiscuous port, as long as the promiscuous port and secondary VLANs are within the same primary VLAN. You may want to do this for load-balancing or redundancy purposes.
You can also have secondary VLANs that are not associated to any promiscuous port.
Isolated--An isolated port is a host port that belongs to an isolated secondary VLAN. This port has

complete isolation from other ports within the same private VLAN domain, except that it can communicate with associated promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports. You can have more than one isolated port in a specified isolated VLAN. Each port is completely isolated from all other ports in the isolated VLAN.
Community--A community port is a host port that belongs to a community secondary VLAN. Community

ports communicate with other ports in the same community VLAN and with associated promiscuous ports. These interfaces are isolated from all other interfaces in other communities and from all isolated ports within the private VLAN domain.

NEW QUESTION: 3
You are building a system to distribute confidential training videos to employees. Using CloudFront, what method could be used to serve content that is stored in S3, but not publicly accessible from S3 directly?
Please select:
A. Add the CloudFront account security group "amazon-cf/amazon-cf-sg" to the appropriate S3 bucket policy.
B. Create a S3 bucket policy that lists the CloudFront distribution ID as the Principal and the target bucket as the Amazon Resource Name (ARN).
C. Create an Identity and Access Management (IAM) User for CloudFront and grant access to the objects in your S3 bucket to that IAM User.
D. Create an Origin Access Identity (OAI) for CloudFront and grant access to the objects in your S3 bucket to that OAl.
Answer: D
Explanation:
You can optionally secure the content in your Amazon S3 bucket so users can access it through CloudFront but cannot access it directly by using Amazon S3 URLs. This prevents anyone from bypassing CloudFront and using the Amazon S3 URL to get content that you want to restrict access to. This step isn't required to use signed URLs, but we recommend it To require that users access your content through CloudFront URLs, you perform the following tasks:
Create a special CloudFront user called an origin access identity.
Give the origin access identity permission to read the objects in your bucket.
Remove permission for anyone else to use Amazon S3 URLs to read the objects.
Option B,C and D are all automatically invalid, because the right way is to ensure to create Origin Access Identity (OAI) for CloudFront and grant access accordingly.
For more information on serving private content via Cloudfront, please visit the following URL:
https://docs.aws.amazon.com/AmazonCloudFront/latest/DeveloperGuide/PrivateContent.html The correct answer is: Create an Origin Access Identity (OAI) for CloudFront and grant access to the objects in your S3 bucket t that OAI.
