NEW QUESTION: 1

You have deployed a Vblock System 320 with two storage pools; one is high performance and the other is general purpose. The customer asks that all the datastores be moved from the general purpose pool to the high performance pool.

Which storage management software would you use?

- A. Unisphere Server Utility
- B. Unisphere Service Manager
- C. Unisphere Client
- D. Unisphere for VMAX

Answer: C

NEW QUESTION: 2

Your company is launching a public website that allows users to stream videos.

You upload multiple video files to an Azure storage container. You need to give anonymous users read access to all of the video files in the storage container.

What should you do?

- A. Edit the container metadata and set the access policy to Public Container.
- B. Edit the container metadata and set the access policy to Public Blob.
- C. Move the files into a container sub-directory and set the directory access level to Public Blob.
- D. Edit each blob's metadata and set the access policy to Public Blob.

Answer: B

Explanation:

Explanation/Reference:

Explanation:

By default, the container is private and can be accessed only by the account owner. To allow public read access to the blobs in the container, but not the container properties and metadata, use the "Public Blob" option. To allow full public read access for the container and blobs, use the "Public Container" option.

NEW QUESTION: 3

Sie entwickeln Abfragen und gespeicherte Prozeduren, um eine Branchenanwendung zu unterstützen.

Sie müssen die entsprechende Isolationsstufe verwenden, die auf dem Szenario basiert.

Welche Isolationsstufen sollten Sie implementieren? Wählen Sie zum Beantworten die entsprechende Isolationsstufe für jedes Szenario im Antwortbereich aus. Jede Isolationsstufe darf nur einmal verwendet werden.

HINWEIS: Jede richtige Auswahl ist einen Punkt wert.

Answer:

Explanation:

Explanation

Box 1: READ UNCOMMITTED

Transactions running at the READ UNCOMMITTED level do not issue shared locks to prevent other transactions from modifying data read by the current transaction. READ UNCOMMITTED transactions are also not blocked by exclusive locks that would prevent the current transaction from reading rows that have been modified

but not committed by other transactions. When this option is set, it is possible to read uncommitted modifications, which are called dirty reads. Values in the data can be changed and rows can appear or disappear in the data set before the end of the transaction.

Box 2: READ COMMITTED

READ COMMITTED specifies that statements cannot read data that has been modified but not committed by other transactions.

SERIALIZABLE specifies that statements cannot read data that has been modified but not yet committed by other transactions.

Box 3: REPEATABLE READ

REPEATABLE READ specifies that statements cannot read data that has been modified but not yet committed by other transactions and that no other transactions can modify data that has been read by the current transaction until the current transaction completes.

Box 4: SNAPSHOT

If READ_COMMITTED_SNAPSHOT is set to ON, the Database Engine uses row versioning to present each statement with a transactionally consistent snapshot of the data as it existed at the start of the statement.

NEW QUESTION: 4

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this sections, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You develop an enterprise application that will be used only by the employees of a company. The application is not Internet-facing. You deploy instances of the application to Azure datacenters on two continents.

You must implement a load balancing solution that meets the following requirements:

- * Provide network-level distribution of traffic across all instances of the application.

- * Support HTTP and HTTPS protocols.

- * Manage all inbound and outbound connections.

Any back-end virtual machine (VM) must be able to service requests from the same user or client session.

Solution: You implement Traffic Manager and Application Gateway.

Does the solution meet the goal?

A. No

B. Yes

Answer: B

Explanation:

Application Gateway works at the application layer (Layer 7 in the OSI network reference stack). It acts as a reverse-proxy service, terminating the client connection and forwarding requests to back-end endpoints. It supports the HTTP, HTTPS, and WebSockets protocols.

Application Gateway is useful for applications that require requests from the same user/client session to reach the same back-end virtual machine. Examples of these applications would be shopping cart applications and web mail servers.

Traffic Manager works at the DNS level. It uses DNS responses to direct end-user traffic to globally distributed endpoints. Clients then connect to those endpoints directly.

Microsoft Azure Traffic Manager allows you to control the distribution of user traffic for service endpoints in different datacenters
