#### **NEW QUESTION: 2**

Which two statements are true about "LICENSE INCLUDED" and "BRING YOUR OWN LICENSE (BYOL)" options while creating a DB system?

- A. License included includes the cost of OCI only.
- B. BYOL includes no extra cost for OCI and Oracle Database.
- C. License included includes the cost of OCI and Oracle

Database license.

**D.** BYOL includes the cost of the Oracle Database only.

**E.** BYOL includes the cost of OCI only.

**Answer: B,C**

Explanation:

Explanation

<https://docs.cloud.oracle.com/en-us/iaas/Content/Database/Concepts/databaseoverview.htm> Oracle Cloud Infrastructure supports a licensing model with two license types. With License included, the cost of the cloud service includes a license for the Database service. With Bring Your Own License (BYOL), Oracle Database customers can use existing licenses with Oracle Cloud Infrastructure. Note that Oracle Database customers remain responsible for complying with license restrictions applicable to their BYOL licenses, as defined in their program order for those licenses.

You do not need separate on-premises licenses and cloud licenses. BYOL databases support all advanced Database service manageability functionality, including backing up and restoring a DB system, patching, and Oracle Data Guard.

You can choose BYOL when you launch an Oracle Cloud Infrastructure database or DB system. Choosing BYOL impacts how the usage data for the instance is metered and subsequent billing.

Note that on some provisioning dialogs in the Console, the BYOL option is labeled My Organization Already Owns Oracle Database Software Licenses.

### **NEW QUESTION: 3**

Your EC2-Based Multi-tier application includes a monitoring instance that periodically makes application -level read only requests of various application components and if any of those fail more than three times 30 seconds calls CloudWatch to fire an alarm, and the alarm notifies your operations team by email and SMS of a possible application health problem. However, you also need to watch the watcher -the monitoring instance itself - and be notified if it becomes unhealthy.

Which of the following is a simple way to achieve that goal?

**A.** Run another monitoring instance that pings the monitoring instance and fires a Cloud Watch alarm that notifies your operations team should the primary monitoring instance become unhealthy.

**B.** Set a Cloud Watch alarm based on EC2 system and instance status checks and have the alarm notify your operations team of any detected problem with the monitoring instance.

**C.** Have the monitoring instances post messages to an SQS queue and then dequeue those messages on another instance. Should the queue cease to have new messages, the second instance should first terminate the original monitoring instance start another backup monitoring instance and assume the role of the previous monitoring instance and begin adding messages to

the SOSQueue.

**D.** Set a Cloud Watch alarm based on the CPU utilization of the monitoring instance and have the alarm notify your operations team if the CPU usage exceeds 50% for more than one minute: then have your monitoring application go into a CPU-bound loop should it detect any application problems.

**Answer: C**

**NEW QUESTION: 4**
