**NEW QUESTION: 3**

Refer to the exhibit.

Which two options are possible states for the interface configured with the given OSPFv3 authentication? (Choose two.)

- A. UNCONFIGURED
- B. GOING DOWN
- C. DOWN
- D. GOING UP

**Answer: C,D**

Explanation:

To configure IPsec, you configure a security policy, which is a combination of the security policy index (SPI) and the key (the key is used to create and validate the hash value). IPsec for OSPFv3 can be configured on an interface or on an OSPFv3 area. For higher security, you should configure a different policy on each interface configured with IPsec. If you configure IPsec for an OSPFv3 area, the policy is applied to all of the interfaces in that area, except for the interfaces that have IPsec configured directly. Once IPsec is configured for OSPFv3, IPsec is invisible to you.

The secure socket API is used by applications to secure traffic. The API needs to allow the application to open, listen, and close secure sockets. The binding between the application and the secure socket layer also allows the secure socket layer to inform the application of changes to the socket, such as connection open and close events. The secure socket API is able to identify the socket; that is, it can identify the local and remote addresses, masks, ports, and protocol that carry the traffic requiring security.

Each interface has a secure socket state, which can be one of the following:

NULL: Do not create a secure socket for the interface if authentication is configured for the area.

DOWN: IPsec has been configured for the interface (or the area that contains the interface), but OSPFv3 either has not requested IPsec to create a secure socket for this interface, or there is an error condition.

GOING UP: OSPFv3 has requested a secure socket from IPsec and is waiting for a CRYPTO\_SS\_SOCKET\_UP message from IPsec.

UP: OSPFv3 has received a CRYPTO\_SS\_SOCKET\_UP message from IPsec.

CLOSING: The secure socket for the interface has been closed. A new socket may be opened for the interface, in which case the current secure socket makes the transition to the DOWN state.

Otherwise, the interface will become UNCONFIGURED.

UNCONFIGURED. Authentication is not configured on the interface.

OSPFv3 will not send or accept packets while in the DOWN state. Reference:
