 - F. Main mode negotiates faster than aggressive mode
- Answer: D,E**

NEW QUESTION: 3

A 6TB Amazon ElastiCache Redis instance is used to store session data for an application. The instance is in the main availability zone of a multi-availability zone region. The application is distributed across multiple availability zones in the region. The application is experiencing a performance issue where users in one availability zone are experiencing a significant increase in latency when accessing the session data. The application is using a read-replica configuration. The application is using a single-threaded architecture. The application is using a single-threaded architecture. The application is using a single-threaded architecture.

- A. Create a new Amazon ElastiCache Redis instance in a different availability zone and update the application to use the new instance.
- B. Create a new Amazon ElastiCache Redis instance in a different availability zone and update the application to use the new instance.
- C. Create a new Amazon ElastiCache Redis instance in a different availability zone and update the application to use the new instance.
- D. Create a new Amazon ElastiCache Redis instance in a different availability zone and update the application to use the new instance.
- E. Create a new Amazon ElastiCache Redis instance in a different availability zone and update the application to use the new instance.

Answer: B,E

Explanation:

- A: 6TB will not resolve the issue permanently.
- B: the issue in the question is writing issue. So why we need read replica!
- C: Kinesis is always best for IoT and load.
- D: does not make sense.

E: the question does not say anything about keeping the same DB architect! Dynamo is so scalable, for indefinitely solution.
