NEW QUESTION: 1

Which two statements are true regarding VMWare Update Manager? (Choose two)

- A. After installing the Update Manager plug-in, you need to immediately create baselines and baseline groups.
- B. Update Manager can only upgrade virtual machines.

C. Update Manager contains, by default, multiple default baselines.

D. Baselines and baseline groups can be created to upgrade hosts, virtual machines, and virtual appliances.

Answer: C,D

NEW QUESTION: 2

The implementation group has been using the test bed to do an IPv6 'proof-of-concept'. After several changes to the network addressing and routing schemes, a trouble ticket has been opened indicating that the loopback address on R1 (2026::111:1) is not able to ping the loopback address on DSW2 (2026::102:1). Use the supported commands to isolate the cause of this fault and answer the following question.

What is the solution to the fault condition?

A. Under the interface Tunnel34 configuration delete the tunnel source Serial0/0/0.34 command and enter the tunnel source 2026::34:1/122 command.

B. Under the interface Tunnel34 configuration delete the tunnel mode ipv6 command.

C. Under the interface Tunnel34 configuration enter the ip address unnumbered Serial0/0/0.34 command.

D. Under the interface Serial0/0/0.34 configuration enter the ipv6 address 2026::34:1/122 command.

Answer: B

Explanation:

As explained earlier, the problem is with route misconfigured tunnel modes on R3. R3 is using tunnel mode ipv6, while R4 is using the default of GRE. We need to remove the "tunnel mode ipv6" command under interface Tunnel34 Ticket 16: IPv6 RIPng OSPFv3 Redistribution Instructions The main screen consists of two parts; the Main scenario and the Topology tabs. The main scenario describes TSHOOT.com test bed. The Topology tabs allow you to display the appropriate and select the trouble ticket. To complete the item, you will first need to familiarize yourself with the TSHOOT.com test bed by clicking on the master scenario first and then the topologies tabs. Once you are familiar with the test bed and the topologies, you should start evaluating the trouble ticket. You will be presented with a Trouble Ticket scenario that will describe the fault condition. You will need to determine on which device the fault condition is located, to which technology the fault condition is related, and the solution to each trouble ticket. This will be done by answering three questions.

Ticket Selection

To begin, click on the Ticket on the Topology tabs.

* Please note. Some of the questions will require you to use the scroll bar to see all options.

* Fault Isolation

Read the ticket scenario to understand the fault condition.

* Open the appropriate topology, based upon the ticket

scenario.

* Open the console of the desired device by clicking on that device in the topology, based upon

* your troubleshooting methodology.

Use the supported show, ping and trace commands to begin your fault isolation process.

* Move to other devices as need by clicking on those devices within the topology.

* Fault Identification

The trouble ticket will include three questions that you will need to answer:

* 1. Which device contains the fault

2. Which technology the fault condition is related to

3. What is the solution to the issue

To advance to the next question within the ticket click on "Next Question".

* When you click "DONE", the trouble ticket will turn RED and will no longer be accessible.

* You may also use the "Previous Question" button to review questions within that specific

* ticket.

To complete a trouble ticket, answer all three questions and click "DONE". This will store your

* response to the questions. Do not click on "DONE" unless you have answered all questions within the ticket.

Item Completion

Click the NEXT button on the bottom of the screen once a ticket is RED. This action moves you

* to the next item.

Topology Overview (Actual Troubleshooting lab design is for below network design) Client Should have IP 10.2.1.3

* EIGRP 100 is running between switch DSW1 & DSW2

* OSPF (Process ID 1) is running between R1, R2, R3, R4

* Network of OSPF is redistributed in EIGRP

* BGP 65001 is configured on R1 with Webserver cloud AS 65002

* HSRP is running between DSW1 & DSW2 Switches

* The company has created the test bed shown in the layer 2 and layer 3 topology exhibits.

This network consists of four routers, two layer 3 switches and two layer 2 switches.

In the IPv4 layer 3 topology, R1, R2, R3, and R4 are running OSPF with an OSPF process number 1.

DSW1, DSW2 and R4 are running EIGRP with an AS of 10.

Redistribution is enabled where necessary.

R1 is running a BGP AS with a number of 65001. This AS has an eBGP connection to AS 65002 in the ISP's network. Because the company's address space is in the private range.

R1 is also providing NAT translations between the inside (10.1.0.0/16 & 10.2.0.0/16) networks and outside (209.65.0.0/24) network.

ASW1 and ASW2 are layer 2 switches.

NTP is enabled on all devices with 209.65.200.226 serving as the master clock source.

The client workstations receive their IP address and default gateway via R4's DHCP server.
The default gateway address of 10.2.1.254 is the IP address of HSRP group 10 which is running on DSW1 and DSW2.
In the IPv6 layer 3 topology R1, R2, and R3 are running OSPFv3 with an OSPF process number 6.
DSW1, DSW2 and R4 are running RIPng process name RIP_ZONE.
The two IPv6 routing domains, OSPF 6 and RIPng are connected via GRE tunnel running over the underlying IPv4 OSPF domain. Redistribution is enabled where necessary.
Recently the implementation group has been using the test bed to do a 'proof-of-concept' on several implementations. This involved changing the configuration on one or more of the devices.
You will be presented with a series of trouble tickets related to issues introduced during these configurations.
Note: Although trouble tickets have many similar fault indications, each ticket has its own issue and solution.
Each ticket has 3 sub questions that need to be answered & topology remains same.
Question-1 Fault is found on which device,
Question-2 Fault condition is related to,
Question-3 What exact problem is seen & what needs to be done for solution

NEW QUESTION: 3

An entity purchased an asset for \$375,000 on 1 November 20X0 incurring legal fees of \$33,000.
Improvements were made to the asset for \$65,000 on 1 December 20X2 which qualified as capital expenditure under the local tax rules. The entity also incurred repair costs on the asset on 1 February 20X3 amounting to \$10,000.
The asset was sold for \$680,000 on 1 December 20X5 incurring allowable costs on disposal of \$15,000.
Indexation on the purchase cost and the improvement are allowable.
The index increased by 20% between November 20X0 and December 20X5, 15% between December 20X2 and December 20X5 and 10% between February 20X3 and December 20X5
Calculate the chargeable gain on the disposal of the asset on 1 December 20X5.

- A. \$100,650
- B. \$107,250
- C. \$89,650
- D. \$90,650

Answer: A

NEW QUESTION: 4

What statement accurately describes the functionality of the IEEE 802.1X standard?

- A. Port-based access control with support for authenticated-user VLANs only
- B. Port-based access control with mandatory support of AES-CCMP encryption
- C. Port-based access control, which allows three frame types to traverse the uncontrolled port: EAP, DHCP, and DNS.
- D. Port-based access control with EAP encapsulation over the LAN (EAPoL)
- E. Port-based access control with dynamic encryption key management and distribution

Answer: D
