NEW QUESTION: 1
You plan to deploy SQL Server 2014. Your company identifies the following monitoring requirements:
* Tempdb must be monitored for insufficient free space.
* Deadlocks must be analyzed by using Deadlock graphs.
You need to identify which feature meets each monitoring requirement.
Which features should you identify? To answer, drag the appropriate feature to the correct monitoring requirement in the answer area.

Answer:
Explanation:

Explanation

* You can use the sys.dm_db_file_space_usage dynamic management view to monitor the disk space used by the user objects, internal objects, and version stores in the tempdb files. Additionally, to monitor the page allocation or deallocation activity in tempdb at the session or task level, you can use the sys.dm_db_session_space_usage and sys.dm_db_task_space_usage dynamic management views. These views can be used to identify large queries, temporary tables, or table variables that are using a large amount of tempdb disk space.
* Use SQL Server Profiler to identify the cause of a deadlock. A deadlock occurs when there is a cyclic dependency between two or more threads, or processes, for some set of resources within SQL Server.
Using SQL Server Profiler, you can create a trace that records, replays, and displays deadlock events for analysis.
* SQL Server Profiler and SQL Server Management Studio use a deadlock wait-for graph to describe a deadlock. The deadlock wait-for graph contains process nodes, resource nodes, and edges representing the relationships between the processes and the resources. NEW QUESTION: 2
A customer needs a networking solution that supports their Microsoft Skype for Business Unified
Communications (UC) solution. The architect discovers that user wireless devices are Wi-Fi Multimedia
(WMM) capable. Windows policies assign voice traffic DSCP 46 and video traffic DSCP 34.
Which potential issue should the architect explain to the customer about the default QoS settings?
A. The DSCP values place both voice and video traffic in the video VMM queue, so voice does not receive
the prioritization that is should.
B. The Aruba APs and controllers use different prioritization mechanism from WMM, so they will not
accept high priority traffic from the wireless devices.
C. The DSCP for wireless client traffic is concealed within the GRE packet on the path from the AP to the
controller, and does not take effect.
D. DSCP is incompatible with WMM. The Aruba APs and controllers instead use 802.1p to mark traffic to
and from wireless devices.
