NEW QUESTION: 1
You have a computer named Computer1 that runs Windows 7. You have a server named Server1 that runs Windows Server 2008. Computer1 and Server1 have IPv4 and IPv6 installed.
You need to identify whether you can connect to Server1 by using IPv6.
What should you do?

A. Open \\server1 from the Run dialog box.
B. Run Ping Server1 -6.
C. Run Net view \\Server1.
D. Run Ping Server1- n 6.
Answer: B
Explanation:
Explanation/Reference:
Explanation:
The Ping tool is still widely used, although more firewalls
block Internet Control Message Protocol (ICMP) echo requests
than used to be the case. However, even if you cannot get past
a firewall on your organization's network, Ping is still
useful. You can check that the IPv4 protocol is working on a
computer by entering ping 127.0.0.1. You can then ping the IPv4
address of the computer. You can find out what this is by using
the Ipconfig tool. If your computer has more than one interface
combined in a network bridge, you can ping the Ipv4 address of
the network bridge. When you have established that you can ping
your computer using an Ipv4 address, you can test that DNS is
working internally on your network (assuming you are connected
to a DNS server, a WAP, or have ICS configured on your network)
by pinging your computer name-for example, entering ping
canberra. Note that if DNS is not implemented on your system,
ping canberra still works because the IPv6link-local address
resolves automatically.
-6Force using IPv6.
