You have a database named Sales.

You need to create a table named Customer that includes the columns described in the following table:

How should you complete the Transact SQL statement? To answer, select the appropriate Transact-SQL segments in the answer area.

**Answer:**

Explanation:

Explanation

Box 1: MASKED WITH (FUNCTION = 'default()')

The Default masking method provides full masking according to the data types of the designated fields.

Example column definition syntax: Phone# varchar(12) MASKED WITH (FUNCTION = 'default()') NULL Box 2: MASKED WITH (FUNCTION = 'partial(3,"XXXXXX",0)')

The Custom String Masking method exposes the first and last letters and adds a custom padding string in the middle. prefix,[padding],suffix examples:

PhoneNumber varchar(10) MASKED WITH (FUNCTION =

'partial(5,"XXXXXXX",0)')

Box 3: MASKED WITH (FUNCTION = 'email()') The Email masking method which exposes the first letter of an email address and the constant suffix ".com", in the form of an email address. [\[email#160;protected\]](#)

## NEW QUESTION: 2

Process-level redundancy is implemented by a system manager process that creates the standby process. What two functions are provided by the system-level process called Qnet Symlink Manager (QSM)? (Choose two.)

- A. provides an abstract name for a process or service
- B. backing up the information for the broken connections
- C. detection of a failed connection
- D. provides common information for connecting processes and services
- E. distribution of symbolic link information

**Answer: A,E**

Explanation:

1.4. SP high end product

1.4.01. IOS-XR structure Process-Level Redundancy Process-level redundancy is implemented by a system manager process creating the standby process. Because the active process created the standby process, the active process has all the information that it needs to communicate with the standby process. The active process uses a checkpoint database to share running state with the standby process. Symbolic links and abstract names are used to identify the processes. Clients do not see the standby process until the active goes away. If a process fails and it has created a standby process, a system-level process called QNet Symlink Manager (QSM) and a library called Event Connection Manager (ECM) are used to re-establish links from the clients to the processes.

QSM provides:

Distribution of symbolic link information

Abstract name for a process or service

ECM provides:

Common information for connecting processes and services

Detection of broken connections

Only processes considered essential by development engineers

are designated to support

process-level redundancy. This is not a user-configurable option.

Clients have to reconnect to the "new" active process (the "original" standby process) when they detect that the active process has failed. Clients can connect to it using the symbolic links and abstract names. The new active process creates a new standby process.

The general steps in process redundancy are:

The active process dies.

The standby process becomes the active process.

A new standby process starts.

The new active process begins sending updates to the new standby process.

Clients begin using the new active process through the symbolic links and abstract names.
