100% Pass Quiz IBM - C1000-122 - Trustable Db2 12 for z/OS DBA Fundamentals Testdump

We provide an instant download for IBM C1000-122 IBM Certification desktop software and C1000-122 PDF questions dumps, And you know what's the best about Buolkab?

The product Buolkab provide with you is compiled by professionals elaborately and boosts varied versions which aimed to help you learn the pass your C1000-122 exam by the method which is convenient for you.

The quality of our products is of course in line with the standards [Db2 12 for z/OS DBA Fundamentals](#) of various countries, These Db2 12 for z/OS DBA Fundamentals exam questions dumps are of high quality and are designed for the convenience of the candidates.

There are so many former customers who appreciated **C1000-122 Testdump** us for clear their barriers on the road, we expect you to be one of them too, Stop hesitating and confusing by different invalid and low-quality products, high-quality C1000-122 questions and answers with reasonable price will be your wise option.

Our C1000-122 exam questions are very accurate for you to pass the C1000-122 exam, Our after sales services are the best in the world, It can also be used on any smartphone or tablet.

Come to buy our C1000-122 exam questions and you will feel grateful for your right choice, You can practice with C1000-122 study materials at anytime, anywhere.

High Hit Rate C1000-122 Testdump Provide Prefect Assistance in C1000-122 Preparation

There is no fear of losing the IBM C1000-122 exam, if you are preparing for your C1000-122 certification exam using Buolkab' products, You should check this page from time to time to ensure that you are happy with any changes.

These dumps are developed by IBM professionals, C1000-122 test questions are not only targeted but also very comprehensive, Our C1000-122 Latest Real Test Questions practice braindumps not only apply to students, but also apply to office workers;

Are you fed up with the dull knowledge, Free C1000-122 Demo Download ExamsLead offers free demo for C1000-122 exam, It is known to us that practicing the incorrect questions is very important for everyone, so our C1000-122 exam question provide the automatic correcting system to help customers understand and correct the errors.

NEW QUESTION: 1

You have a server named Server1 that runs Windows Server 2012 R2.

You plan to enable Hyper-V Network Virtualization on Server1. You need to install the Windows Network Virtualization Filter Driver on Server1.

Which Windows PowerShell cmdlet should you run?

- A. Enable-NetAdapterBinding
- B. Set-NetVirtualizationGlobal
- C. Set-NetAdapterVmq
- D. Add - WindowsFeature

Answer: A

Explanation:

Explanation/Reference:

Explanation:

Hyper-V Network Virtrtualization runs multiple virtual networks on a physical network. And each virtual network operates as if it is running as a physical network. The The Set-NetAdaptercmdlet sets the basic properties of a network adapter such as virtual LAN (VLAN) identifier (ID) and MAC address. Thus if you add the binding parameter to the command then you will be able to install the Windows Network Virtualization Filter Driver.

Step one:Enable Windows Network Virtualization (WNV). This is a binding that is applied to the NIC that you External Virtual Switch is bound to. This can be a physical NIC, it can be an

LBFO NIC team. Either way, it is the network adapter that your External Virtual Switch uses to exit the server. This also means that if you have multiple virtual networks or multiple interfaces that you can pick and choose and it is not some global setting. If you have one External Virtual Switch this is fairly easy:

```
$vSwitch = Get-VMSwitch -SwitchType External# Check if Network
Virtualization is bound# This could be done by checking for the
binding and seeing if it is enabledForEach-Object -InputObject
$vSwitch {if ((Get- NetAdapterBinding-ComponentID "ms_netwnv"
-InterfaceDescription
$_.NetAdapterInterfaceDescription).Enabled -eq $false){# Lets
enable itEnable-NetAdapterBinding- InterfaceDescription
$_.NetAdapterInterfaceDescription -ComponentID "ms_netwnv"}}}
```

NEW QUESTION: 2

- A. IPv4 OSPF Redistribution
- B. BGP
- C. IP NAT
- D. NTP
- E. IPv4 OSPF Routing
- F. IPv4 layer 3 security
- G. IPv6 OSPF Routing

Answer: C

Explanation:

On R1 we need to add the client IP address for reachability to server to the access list that is used to specify which hosts get NATed.

Topic 11, Ticket 6 : R1 ACLTopology Overview (Actual Troubleshooting lab design is for below network design)

- * Client Should have IP 10.2.1.3
- * EIGRP 100 is running between switch DSW1 & DSW2
- * OSPF (Process ID 1) is running between R1, R2, R3, R4
- * Network of OSPF is redistributed in EIGRP
- * BGP 65001 is configured on R1 with Webserver cloud AS 65002
- * HSRP is running between DSW1 & DSW2 Switches

The company has created the test bed shown in the layer 2 and layer 3 topology exhibits.

This network consists of four routers, two layer 3 switches and two layer 2 switches.

In the IPv4 layer 3 topology, R1, R2, R3, and R4 are running OSPF with an OSPF process number 1.

DSW1, DSW2 and R4 are running EIGRP with an AS of 10.

Redistribution is enabled where necessary.

R1 is running a BGP AS with a number of 65001. This AS has an eBGP connection to AS

6 5002 in the ISP's network. Because the company's address space is in the private range.

R1 is also providing NAT translations between the inside (10.1.0.0/16 & 10.2.0.0/16) networks and outside

(209.65.0.0/24) network.

ASW1 and ASW2 are layer 2 switches.

NTP is enabled on all devices with 209.65.200.226 serving as the master clock source.

The client workstations receive their IP address and default gateway via R4's DHCP server.

The default gateway address of 10.2.1.254 is the IP address of HSRP group 10 which is running on DSW1 and DSW2.

In the IPv6 layer 3 topology R1, R2, and R3 are running OSPFv3 with an OSPF process number 6.

DSW1, DSW2 and R4 are running RIPng process name RIP_ZONE.

The two IPv6 routing domains, OSPF 6 and RIPng are connected via GRE tunnel running over the underlying IPv4 OSPF domain.

Redistribution is enabled where necessary.

Recently the implementation group has been using the test bed to do a 'proof-of-concept' on several implementations. This involved changing the configuration on one or more of the devices. You will be presented with a series of trouble tickets related to issues introduced during these configurations.

Note: Although trouble tickets have many similar fault indications, each ticket has its own issue and solution.

Each ticket has 3 sub questions that need to be answered & topology remains same.

Question-1 Fault is found on which device,

Question-2 Fault condition is related to,

Question-3 What exact problem is seen & what needs to be done for solution

Client is unable to ping IP 209.65.200.241...

Solution

Steps need to follow as below:-

* When we check on client 1 & Client 2 desktop we are not receiving DHCP address from R4

* Ipconfig ----- Client will be receiving IP address 10.2.1.3

* IP 10.2.1.3 will be able to ping from R4 , R3, R2, R1

* Look for BGP Neighbourship

* Sh ip bgp summary ----- State of BGP will be in active state.

This means connectivity issue between serial

* Check for running config. i.e sh run --- over here check for access-list configured on interface as BGP is down (No need to check for NAT configuration as its configuration should be right as first need to bring BGP up)

* In above snapshot we can see that access-list of edge_security on R1 is not allowing wan IP network

* Change required: On R1, we need to permit IP 209.65.200.222/30 under the access list.

NEW QUESTION: 3

- A. SnapVault toVolume SnapMirror to SnapVault
 - B. Volume SnapMirror to SnapVault
 - C. SnapVault toVolume SnapMirror
 - D. SnapVault toVolume SnapMirror toVolume SnapMirror
- Answer: B,C,D**
