correct order
B. Route an assignment to a work queue where both roles have access
C. Create an approval step with cascading approval
D. Create an approval process for each manager in parallel
Answer: C

NEW QUESTION: 2
Which of the following encryption algorithms does NOT deal with discrete logarithms?
A. Diffie-Hellman
B. Elliptic Curve
C. RSA
D. El Gamal
Answer: C
Explanation:
Explanation/Reference:
Explanation:
RSA does not deal with discrete logarithms.
RSA, named after its inventors Ron Rivest, Adi Shamir, and Leonard Adleman, is a public key algorithm that is the most popular when it comes to asymmetric algorithms. RSA is a worldwide de facto standard and can be used for digital signatures, key exchange, and encryption. It was developed in 1978 at MIT and provides authentication as well as key encryption.
The security of this algorithm comes from the difficulty of factoring large numbers into their original prime numbers. The public and private keys are functions of a pair of large prime numbers, and the necessary activity required to decrypt a message from ciphertext to plaintext using a private key is comparable to factoring a product into two prime numbers.
Incorrect Answers:
A: El Gamal is a public key algorithm that can be used for digital signatures, encryption, and key exchange.
It is based not on the difficulty of factoring large numbers but on calculating discrete logarithms in a finite field.
B: The Diffie-Hellman algorithm enables two systems to generate a symmetric key securely without requiring a previous relationship or prior arrangements. The algorithm allows for key distribution, but does not provide encryption or digital signature functionality. The algorithm is based on the difficulty of calculating discrete logarithms in a finite field.
D: The Elliptic Curve algorithm computes discrete logarithms of elliptic curves, which is different from calculating discrete logarithms in a finite field.

NEW QUESTION: 3
Refer to the exhibit. The output that is shown is generated at a switch. Which three statements are true? (Choose three.)

A. Thirty VLANs have been configured on this switch.
B. All interfaces that are shown are on shared media.
C. The bridge priority is lower than the default value for spanning tree.
D. All designated ports are in a forwarding state.
E. This switch must be the root bridge for all VLANs on this switch.
F. All ports will be in a state of discarding, learning, or forwarding.
Answer: C,D,F
Explanation:
From the output, we see that all ports are in Designated role (forwarding state) -> A and E are correct.
The command "show spanning-tree vlan 30 only shows us information about VLAN 30. We don't know how many VLAN exists in this switch -> B is not correct.
The bridge priority of this switch is 24606 which is lower than the default value bridge priority 32768 -> C is correct.
All three interfaces on this switch have the connection type "p2p", which means Point-to-point environment -not a shared media >; D is not correct.
The only thing we can specify is this switch is the root bridge for VLAN 3o but we cannot guarantee it is also the root bridge for other VLANs -> F is not correct.
