You can alter how the Intelligent Placement algorithm works on your VMM server. There are two basic models:

Resource Maximisation: This is the model you take when you want

VMM to make the very most out of each and every host. VMM will try to place as many VM's on a single host as is reasonable.

Load Balancing: The goal here is to get the very best performance from your VM's that you can. VMM will locate VM's in an effort to balance the resource utilisation across all hosts.
